It allows users to create and modify 2D and 3D drawings, models and web pages. It includes components to produce 2D and 3D graphics for 2D and 3D printing and 3D scanning applications. The AutoCAD application can also work in tandem with other 3D CAD software programs such as Autodesk 3ds Max and Autodesk Revit Architecture. It has over 25,000 plugins, which gives it extensive functionality and customisation. There are 18 different user interface languages. AutoCAD was first released on microcomputers with internal graphics controllers, in December 1982. In 1986, the first version for the Apple Macintosh was released. The first version for DOS was released in 1989, and AutoCAD for Windows was released in 1997. AutoCAD is one of the most widely used CAD programs worldwide, with more than 300 million users. History Edit With the development of the first generation of the Apple Macintosh computer in 1984, the need for an affordable CAD program became obvious. In November 1985, Autodesk hired freelance software developer John K. Tung to develop the AutoCAD user interface and program logic.[4] The initial version of AutoCAD for the Apple Macintosh was designed to be used in a CAD environment as a second-tier program, along with NAG's AutoDraw.[4] The first version of AutoCAD ran as a DOS application, using file-based drawing format files as its internal data format. This version of AutoCAD was released to the public on October 30, 1986. The name AutoCAD was derived from AutoDraw. Before the official release, several versions of AutoCAD were released. The first version was released on December 12, 1986, as AutoCAD 2.1 on the Apple Macintosh.[4] It was a first version of AutoCAD, supporting the file-based drawing format.[5] This version was not released for the DOS platform. The second version was released in September 1987 as AutoCAD 2.5.1 for the Macintosh, and AutoCAD 2.5.1 for the DOS.[4] AutoCAD 3.0 was released for the Macintosh and DOS on December 16, 1987. This release was a major update. AutoC

[An evaluation of the multiple effects of storage time and temperature of the sera on the quantitative determination of C-reactive protein (CRP) by immunonephelometry]. We studied the effects of storage time and temperature of the sera on the quantitative determination of C-reactive protein (CRP) by immunonephelometry. In controls, the results of 30 consecutive determinations were stable when stored at -20 degrees C for up to 6 months. No modifications were observed when measurements were carried out at +4 degrees C for 5 days, and between +4 and +25 degrees C for 7 days. Thus, measurements at +4 degrees C for 5 days and between +4 and +25 degrees C for 7 days seem sufficient to obtain reliable results. Chlorine is used in a variety of processes and products in the food and beverage industry. For example, chlorine is commonly used in water treatment to disinfect, sanitize, and inactivate pathogenic organisms in drinking water and wastewater. In the food and beverage industry, chlorine is commonly used to disinfect raw and processed foodstuffs (e.g., fruit and vegetables, poultry, meats, dairy products, etc.). The chlorine may be added directly to the foodstuffs during processing and/or to water used to wash foodstuffs during post-processing treatment, such as in a washing or rinsing operation. The disinfection of drinking water by means of the chlorination of surface and ground waters is the most widely used method of treating water in the United States. In particular, chlorinated water is used to treat more than 65% of all drinking water. In Canada, water treatment plants add chlorine to raw water prior to distribution to drinking water users. In the washing of foodstuffs, such as fruits and vegetables, chlorine is commonly used in combination with other chemicals to treat foodstuffs to reduce the populations of pathogenic and spoilage microorganisms that could cause food spoilage or make the foodstuffs unsafe for consumption. For example, chlorinated water is commonly used to wash foodstuffs in commercial food preparation establishments, such as restaurants and fast food facilities, to inactivate potentially pathogenic microorganisms and other bacteria
