Photoshop CS5 for Mac Photoshop CS5 is the newest version of the venerable image editing program and it comes with a number of great new features and enhancements. While it still boasts many of the same powerful functions of its predecessors, some of the features are more user-friendly. The most obvious new feature in Photoshop CS5 is the new Camera Raw module in the Photoshop CS5 App Suite. While Photoshop used to do all of the photography related work, the App Suite now includes the Camera Raw module, which basically enables editing from raw (the original) files directly in Photoshop. Pardon the awkward phrasing, but it's really best to think of Camera Raw as a software filter which enables users to edit, or "filter," specific aspects of raw files before they go on to complete their

photo-editing job. The difference between this feature and the previously existing Lightroom or Aperture versions of Photoshop can be summed up in two simple words: it's integrated. Lightroom and Aperture used to be separate programs, but the Camera Raw module has now been integrated into both programs. This means users can make adjustments to their photos by taking them straight from raw files in Lightroom or Aperture, and then save the final edits in Photoshop. In fact, even Lightroom users can now use Photoshop CS5 as a plugin for editing raw files. The Camera Raw plug-in is free and works with Lightroom 3 or later, in case you're not familiar. Once you've opened a raw file in Lightroom, you simply go to the File menu, choose Export (or you can press Command + S), and choose the Photo menu from the drop-down list. From there you can "import" your image in Photoshop as a filtered RAW file. Users of Lightroom also get the ability to save a Photoshop CS5 canvas as a Photoshop Layers file. This is sort of like making an indirect shadow copy of a file or document, except it's for images. There are even changes to camera calibration that are a result of the new Camera Raw module. Using the Camera Raw module enables the camera profile, shutter speed, and aperture to be automatically detected when a raw file is opened. The ability to automatically detect these settings is a rare and valued feature and it only works when you use the Camera Raw module. To use the new Camera Raw module, go to Adobe.com and download and install the Photoshop CS5

Latest Tweets from @PresentingExports DTN - A New Way To Manage Riskier Freight This is the first in a series of articles looking at new risk management techniques that DTN has developed to help freight carriers and shippers better manage risks associated with today's volatile, global environment. As global trade continues to grow, many of the nation's ports have been incorporated into an intermodal transportation system. Freight rail, highway and water all provide a platform for goods to move from the place of origin to the place of destination. Typically, freight is carried from an originating freight hub to a destination freight hub by either truck or railroad. Many times, the same carrier provides the transportation from the origin to the destination. However, more shippers and carriers have begun utilizing third-party logistics (3PLs), including brokers, brokers and consolidators, or simply carriers that partner with existing logistics providers to help move their freight. These 3PLs (or shippers) provide transportation services from one time-consuming process to another, such as from origin to destination, or a combination of all three. 3PLs provide shipping services to shippers who might not have the resources to handle a large volume of shipments. As the demand on 3PLs increases, they can seek additional shipping partners to share the cost. These cost-sharing relationships, however, can come with a price — increased risk. There are several terms freight

and freight forwarding companies use to define their risk appetite, which stands for how much of a carrier's risk is acceptable. While the terms vary depending on the carrier, the terms tend to group similar responses together. Typically, three types of risk response are part of the definition of risk appetite. In addition to the above three risks, the amount of risk that a freight forwarding company accepts and its associated cost can vary depending on the type of industry they are in. For example, a transport company in the technology space will have a higher level of risk exposure than a freight carrier in the retail industry. Shippers and carriers alike need to understand their risk appetite in order to properly identify their risk tolerance. What Is Carrier Risk Appetite? The following three risks apply to the carrier: Goods Missing — The carrier is at risk of goods missing between origin and destination if their company's transportation network is not sufficient in volume, capacity and speed. Loss —

Q: How to remove duplicate values in different levels of nested list? I have a list as such: test_list = [['w', 'e', 'f', 'a'], ['y', 't', 'h', 'n'], ['g', 'b', 'i', 'n'], ['m', 'n','m','m'], ['a', 'a', 'n', 'r'], ['y', 't', 'h', 'n'], ['w', 'a', 'r', 'n']] I want to remove the duplicate values at different levels. For example I want my result to be: test_list = [['w', 'e', 'f', 'a'], ['y', 't', 'h', 'n'], ['g', 'b', 'i', 'n'], ['a', 'a', 'n', 'r'], ['m', 'n','m','m'], ['w', 'a', 'r', 'n']] I thought of using for loops to

remove the duplicates, but I'm not really sure how to do it. Please help. A: Use nested list comprehension: result = [[k for i in tl for k in i] for tl in test_list] More readable is: result = [[i for sub_tl in tl for i in sub_tl] for tl in test_list] Q: Does HTML templating require the server to download all template files? Suppose you have an HTML file containing a bunch of elements like: {{Title}} {{Text}} Obviously you don't want to load all those elements on every request. Therefore you can precompile these elements and store them on your server: Example.html {{Title}} {{Text}} $('img').attr("src", function (i, src) { return src
