The prognosis of the pulmonary hypertension in the premature infants has been improved with the modern treatments. However, the intensive care of these patients remains still challenging. Respiratory distress syndrome in infants is a respiratory disorder of the premature babies who require artificial ventilation. Pulmonary hypertension is often present during the early stage of respiratory failure. It is associated with the poor outcome, such as death or chronic lung disease. It is important to treat pulmonary hypertension of premature infants in the early stage. The vasodilators can be used, but the effects are limited. In case of respiratory failure, extracorporeal membrane oxygenation can be effective for the unresponsive cases. Even though the morbidity and mortality remain high, the continuous advances in critical care technologies have been made. We have to be conscious for the prognosis of these patients.After being proven right, now it's time for ca3bfb1094
