Field of the Invention The present invention relates to a system and method for providing multiple data rates for a data stream of information and, in particular, to a system and method for utilizing the bandwidth of packetized information and its error correction capabilities to support multiple data rates. 2. Description of the Related Art Various data protocols may be used to provide communication between a sender and a recipient. For example, a Local Area Network (LAN) is a system of interconnected personal computer systems linked by a physical medium (e.g. a network of electrical, optical or wireless connections) that allows for the exchange of information between these systems. In a fiber optical Ethernet LAN, for example, the physical medium is typically an optical fiber cable, electrical wiring or wireless transmissions carried over a line.

Ethernet is a common standard for such networks. Various types of computers are typically linked together by Ethernet networks and work more or less independently, depending on the design of the Ethernet network. Typical Ethernet networks comprise several segments, each of which acts as a networked LAN. Normally, each Ethernet LAN within an Ethernet network has its own network address. A network computer uses the “broadcast” function on the Ethernet LAN, thereby allowing the network computer to simultaneously transmit data to every other network computer. Data that is broadcast over an Ethernet LAN originates at a source station and travels from that station to a destination station on the LAN. A data packet may be transmitted over the Ethernet LAN in any number of ways. For example, data may be transmitted as a frame within a byte stream and the frame may be sent as a Synchronous Optical Network (SONET) cell, an Asynchronous Transfer Mode (ATM) cell, or the like c6a93da74d
