
WinAlign 9.2 2009

Download

the winalign 9.2 software will then launch and will require you to specify the source and target versions of the source files. after you have specified the source and target versions, click align. you'll be able to see the results in the preview window. once the alignment is complete, click ok to close the software. if there are problems, click help to get additional information about the alignment. if you see a blue box on the left side of the windows taskbar, the alignment is still in progress. it appears that windows 98 is still waiting for the alignment process to complete. to finish the process, the blue box must disappear. at that point, you can continue to use the computer. you can also force windows 98 to end the alignment process by starting the task manager and right-clicking on the process called winalign.exe. after you have ended the alignment process, the blue box that was on the left side of the windows taskbar can reappear if the alignment is not successful. a progress bar on the right side of the task manager may also indicate that the alignment is still in progress. a messagebox will appear if winalign is unable to find the winsta.dll file. you can try to locate the winsta.dll file by using windows explorer to look in the windows directory, program files directory or the windows subdirectory. the alignment process can be started manually by launching the winalign setup program. this program

can be started from the windows 98 start menu or from the windows 98 shortcut menu. if the alignment process is still in progress, you can end it by clicking on the stop button on the windowssystem taskbar. after the alignment process is stopped, a progress bar will appear on the right side of the task manager.

WinAlign 9.2 2009

i use winalign to align program files (exes) and dll files. i prefer to align by using these utilities because i hate to have to download the files to another computer or perform manual alignment. although you can manually align files, it is not as efficient as using winalign. i have used winalign to align hundreds of applications and it usually works well. after selecting the project type, the next step is to choose the file to be aligned. because winalign is an add-on to winalign, you can choose a file from the winalign project. however, the winalign project will not store the file. once you have selected a file, the winalign utility will display a list of matching segments in your source document. after selecting the segments to be aligned, the program will begin to align them. once the program has finished aligning the segments, they will appear in the winalign project. note that the alignment of segments is based on the character position. this means that if there is a word that is split into two segments, the winalign program will align each of those segments separately. for example, if the word "while" is found in a sentence, the "i" and "e" will be aligned separately. in this case, you will have one entry in the translation memory for the "while" word, not two. the same is true for segments that are found at the beginning or end of the document, like the word "the" in the following example: "the han..", "the second.", "the fourth." in the winalign project, you can see the alignment of the segments for a selected word. to do this, right-click on the word in the winalign project and select the "align" command. once the segments are aligned, you can use the translation memory to make sure that the segments are appropriately identified and translated. for example, if you translated the word "the" as "en el", you would type in "the" in the translation memory box.
