Align is a small-sized command-line application that can be used to align text within files, in order to create columns. It supports ASCII text files and can identify text separated by commas or white space, thanks to the fact that it features support for CSV files, too. If the input fields have spaces, then you can enclose them in single or double quotes or C comments /*. */ or //. This is necessary to avoid confusion with the space delimiter. The syntax for the console-based application is simple: "align filename.txt". You just have to specify the name of the plain text document whose contents you want to put into columns. Overwrites the original file with the sorted text After hitting the Enter key to trigger this action, the tool shows no additional message, unfortunately, so you have to investigate matters on your own. We've noticed that it doesn't create new files for each processed item. Instead, it overwrites the original file, replacing it with column-sorted text.
