Excess pyrene binds DNA in a non-intercalative manner with a binding constant of $5.2 \times 10^{5}$ M$^{-1}$. This is confirmed by the fluorescence resonance energy transfer observed between the neutral pyrene excited at 370 nm and the intrinsic pyrene in the DNA. A simple adsorption measurement technique is developed and used to estimate the DNA-pyrene interaction on a single strand on a microtitre plate. The structure of pyrene bound to DNA is studied by single strand conformation polymorphism (SSCP) analysis in a polyacrylamide gel. Under certain conditions dsDNA forms a well-defined complex with pyrene as confirmed by SSCP analysis. The possible influence of the intercalator binding of anthracycline antibiotics on their interaction with the DNA is also discussed.News Romeo & Juliet turns 25 Carmen Lojkis of the Old Globe Theatre in Chicago and Brian H. Gilbert of Shakespeare Theatricals in New York City commemorate the 25th anniversary of Romeo & Juliet, at which time they presented the play in English and Irish in Los Angeles. Lojkis and Gilbert are also co-directors of the play. During a rehearsal break, they celebrated the twenty-fifth anniversary of the production and were joined by some actors who have appeared in the past productions, including Charles Macon, Gloria Chacón, Susan Aldrich, Mary Kay Michaels, Gregory
